ProDOS Macro Assembler

We are now shipping the ProDOS version of the S-C Macro Assembler. As reported last month, the ProDOS version alone is \$100 and the DOS and ProDOS versions together are \$120. The ProDOS update for owners of the DOS Version 2.0 is \$30, and for owners of DOS Version 1.x is \$50.

The S-C Cross Reference Utility and the Laumer Research Full Screen Editor have been updated to ProDOS versions. The ProDOS code will be included on the back of the disk in all new shipments, and current owners can return their original disks to be updated at a cost of only \$5 per program.

65802 Chips

Good News! We have arranged a quantity price on 65802 processors, so we will be able to sell them to our readers for only \$50 + shipping. That's only \$51.50 in the US for this powerful new 16-bit processor that plugs right into your Apple II, II+, //e, or //c. Combine this chip with the S-C Macro Assembler Version 2.0 and you can start writing faster, more compact code. Order yours today!

Updated VideoTerm Driver

We recently revised the Videx VideoTerm driver in the S-C Macro Assembler Version 2.0 to make it firmware-independent and ViewMaster-compatible. This revision is effective with Serial Number T-1483, so owners of earlier copies can send in their original disks and \$5 for an updated copy.

Reading DOS 3.3 Disks With ProDOS.....Bob Sander-Cederlof

At the track and sector level, DOS 3.3 disks are identical to ProDOS disks. They both have 35 tracks, 16 sectors, and the sectors are laid out on the tracks the same way in both systems. You can use DOS's COPYA program to copy ProDOS disks, and you can use some ProDOS utilities on DOS disks.

The structure of the files is of course entirely different between the two systems. Hence the need for the CONVERT program found on ProDOS system master disks, and the System Utilities Disk that comes with the //c. Unfortunately both of the above programs have bugs that get in the way nearly every time I want to move a file from DOS to ProDOS. The one that bites me the most is the way CONVERT dies when it encounters a DOS filename which does not start with a letter. We routinely use such "illegal" filenames on our disks to separate and identify sections of long catalogs, but CONVERT goes absolutely crazy when it finds one.

Therefore, I decided to write a program which could "LOAD" assembler source files from a DOS 3.3 disk while I am running the ProDOS version of the S-C Macro Assembler. Even with error messages and other fancy features, the program turns out to be only a little over \$280 bytes long, and it works.

It is based on the fact that the Block Read MLI call does not care whether the disk being read is a DOS or a ProDOS disk. The Block Read MLI call reads 512 bytes, or two sectors, at a time. The call looks like this:

```
JSR $BF00      (MLI link in global page)
.DA #$80       (block read code)
.DA PARMLIST   (address of parameters)
```

MLI returns with carry clear if there was no error, or carry set if there was an error. The error code will be in the A-register if there was an error.

The PARMLIST for Block Read looks like this:

```
PARMLIST .DA #3      (3 parameters)
         .DA #$60     (1-byte unit number)
         .DA BUFFER   (address of 512-byte buffer)
         .DA 2        (2-byte block number)
```

Page 3-17 of "Beneath Apple ProDOS" contains a table which converts block numbers to physical track/sector, and vice versa. The latest printing of the book also includes a line which correlates the physical sector values to the DOS 3.3 logical sector. Boiling it down, you can derive a ProDOS block number from the DOS 3.3 logical sector by multiplying the track number by 8 and adding a value according to the sector number from the following table:

DOS sector #:	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
	0	7	6	6	5	5	4	4	3	3	2	2	1	1	0	F

For example, track 0 sector 2 is in ProDOS block 6. The only problem is, so is DOS track 0 sector 3. We also need to remember whether a given sector is in the upper or lower half of a 512-byte block.

I developed the following subroutine, which will translate the DOS logical track and sector numbers into the appropriate block number, read the block, and return with the address of the buffer page in which the sector data has been read. Call the routine with the track number in the A-register and the sector number in the X-register. The high-byte of the buffer address will return in the X-register. If MLI detects an error, the subroutine will return with carry set.

```

```

After playing with the subroutine a while, I proceeded to write the load program. Using a well-worn copy of "Beneath Apple DOS", I figured out once more how to work through a DOS catalog. I decided to display a menu of files on the screen, and allow a single keystroke to select a file to be loaded.

The program that follows is designed to work with the ProDOS version of the S-C Macro Assembler. Assuming it has been assembled and is in a ProDOS binary file as DOS.LOAD, and assuming you have booted the ProDOS version of the S-C Macro Assembler, you can start up the load program by typing "-DOS.LOAD". It will load source files from DOS disks, which are DOS type I files, and place them in the assembler's edit area. After selecting the slot and drive, the program reads the DOS catalog and displays 20 filenames at a time. Only type I filenames are displayed, any others are skipped over. If there are more than 20 files, you can page through them. If

you change your mind about loading a file, you can abort. If you see the file you want to load, you type a single letter to select it. A few seconds later it has been loaded, and you are returned to the assembler.

The assembler's soft entry point is at \$8003, and the load program jumps there after finishing a load or after encountering an error. Three pointer locations in page zero which the assembler uses are used by the load program: HIMEM (\$73,74) points one byte higher than the program can be loaded; PP (\$CA,CB) will point to the beginning of the program, if it is successfully loaded; LOMEM (\$67,68) points to the lowest address the program can occupy. HIMEM is normally at \$7400, and LOMEM at \$1000, but these can be changed with the HIMEM and LOMEM commands. LOMEM could be set as low as \$0800.

With these limitations on the program extent (\$0800...73FF), you can see that the maximum size assembler source file that can be loaded from a DOS disk is \$6C00 bytes, or 108 sectors. Or, if you prefer to leave LOMEM at \$1000, you can load \$6400 bytes or 100 sectors. Most likely you do not have any source files which are bigger than that anyway. If you do, you need to load the DOS version of the assembler and split the files before they can be transferred to ProDOS. The maximum size file of 108 data sectors would only have one track/sector list, so I did not include any logic to chain to a second track/sector list. You may be wondering where the load program itself loads....

The command interpreter I developed for the ProDOS version of the S-C Macro Assembler has three 1024-byte buffers permanently allocated between \$7400 and \$7FFF. None of them will be in use while the load program is executing, so I borrowed some of that space for the load program. The load program itself loads inside the buffer space allocated to the EXEC command, at \$7400-77FF. The blocks read by MLI will be stored at \$7C00-7DFF, and I will save a copy of the track/sector list for the file being loaded at \$7E00-7EFF.

Now for a description of the actual code. Lines 1270-1410 ask you to type in the slot and drive numbers of the floppy drive the DOS disk is in. ProDOS uses a "unit number", which is a coded form of the slot and drive all in one byte. The slot number is in bits 4-6 and the drive number (0 or 1, corresponding to drives 1 or 2 respectively) in bit 7. My subroutine GETNUM prints a prompt message (selected by the Y-register), inputs a single character from the keyboard, and checks it for legal range. GETNUM is designed to accept only digits, starting with "1", and up to but not including the value in the A-register when GETNUM is called.

Once the unit number has been established, we fall into the LOAD.MENU code. This code is somewhat convoluted, enough to disgust even me. Interlocking loops? Multiple entries and exits? Ouch! Maybe it really IS structured code, but just not in Euclidean space. I think maybe it could be diagrammed on the surface of a Klein bottle (recursive torus?).

Anyway, let's walk through it. Line 1440-1500 set up a fresh menu display and read in the DOS VTOC page so we can start reading the catalog. The second and third bytes in the VTOC page give the track and sector of the first catalog sector. This is almost always track \$11, sector \$0F; however, by starting at VTOC, we are a little more general. We are still assuming we know where the VTOC is, which is track \$11, sector 0. Some non-standard software sets up disks with the VTOC somewhere else, but you are very unlikely to find any S-C source code on such a disk. Each sector of the catalog also contains the track/sector of the next catalog sector in the 2nd and 3rd bytes.

Lines 1530-1550 read in the next catalog sector and set the pointer to the first file entry in that sector. Each file entry is 35 bytes long, and the first one starts at \$0B within the sector. The subroutine READ.NEXT.CATALOG.SECTOR will return with carry set if there are no more catalog sectors. The first time through this code, when we fall in from the code above, we will read the first catalog sector.

Lines 1570-1960 pick up filenames out of the catalog sectors and write them on the screen. Not all file names are used: line 1610 filters out deleted files; lines 1660-1700 filter out files which are not type I. The track and sector of the active type-I files are saved in an array, indexed by the menu letter. These values are first picked up in lines 1620-1650, and added to the array in lines 1870-1940. Lines 1720-1770 print the menu letter and two dashes, and then lines 1780-1850 print the filename.

Lines 1950-1960 decrement the line count and test if the screen is full yet. I arbitrarily call a screen full if it has 20 filenames, leaving room for my three-line prompt message. We jump to MENU.SELECTION when we reach 20 lines or when we reach the end of the catalog, whichever comes first

If we are not yet at the end of catalog and have not yet filled the screen, or if the file was one that got filtered out of the menu, we come to GET.NEXT.FILE at line 1980. Lines 1990-2040 update the pointer into the catalog sector so that it points at the next file, if there is another one. If so, we branch back to NEXT.FILE.NAME, to try the next one in the current sector. If no more names in this sector, we go back to NEXT.CAT.SECTOR to get the next catalog sector (if any).

When we reach the end of catalog, lines 2070,2080 set a flag. We need a flag to tell whether it was screen-full or catalog-end which caused us to come to MENU.SELECTION, so we can either continue through the catalog or wrap-around to the beginning should you wish to see another screenful of filenames.

The MENU.SELECTION section prints a three-line prompt message and waits for you to type a character. If you type a space, you see the next screenful of filenames. (Of course, if there are fewer than 21 type I files on the disk you will see the same ones over again.) If you type the RETURN or ESCAPE keys, the load program will abort, returning directly to the

**NEW
PRODUCT**

IIC SYSTEM CLOCK

- Fully ProDOS compatible
- Automatic time and date stamping
- Easy to use from BASIC
- Battery operated, uses 3 "AA" batteries (will last 1-2 years before simple replacement)
- Date has year, month, date and day of week
- Time has hours, minutes and seconds
- Will time and date stamp AppleWorks files
- Will display time and date on the AppleWorks screen
- Auto access from AppleWorks data-base (just use a time and date field)
- Pass through serial port - The IIC system clock can plug into either the modem or printer serial port, then modem or printer plugs into the clock
- No hassle 5 year warranty
- Only \$79.00

assembler without loading a file. If you type a letter in the range of the menu, that file will be loaded. Any other key is ignored.

Lines 2260-2370 convert the menu letter you typed into an index to get the track and sector for the track/sector list of the selected file. The track/sector list contains the track and sector for every data sector in the file. Line 2310 reads the track/sector list, and lines 2330-2370 copy it into a special buffer.

The first two bytes of the first data sector of a type-I file contain the length of the file. We need to know the length so we can figure out where to read the data. Lines 2390-2510 read in the first data sector and get the file size.

Lines 2520-2630 figure out where PP should be set so that the file exactly fits between PP and HIMEM, and checks to make sure that it does not go below LOMEM.

Lines 2650-2670 copy the rest of that first sector into the load area, starting at PP. If the file is so short it doesn't fill the first data sector, the LOAD.FROM.SECTOR subroutine will return with carry set and we will return to the assembler, all finished. Otherwise, we fall into the code below, to load the succeeding data sectors. Eventually we will bump into HIMEM, and we are finished.

Now that this program is working I can see neat ways to extend it. Why restrict it to type-I files? It could also BLOAD type-B files, as long as an appropriate load address was set up. It could do the equivalent of a BLOAD on a type-T file, which then could be BSAVE as type TXT in ProDOS. Seems like we might be able to do away with the need for CONVERT, at least in the direction of moving from DOS to ProDOS.

DISASM 2.2e - AN INTELLIGENT DISASSEMBLER : \$30.00

Investigate the inner workings of machine language programs. DISASM converts machine code into meaningful, symbolic source. Creates a standard text file compatible with S-C, LISA, ToolKit and other assemblers. Handles data tables, displaced object code & even lets you substitute your own meaningful labels. (100 commonly used Monitor and Pg Zero names included.) An address-based triple cross reference table is provided to screen or printer. DISASM is an invaluable machine language learning aid to both novice & expert alike. Don Lancaster says DISASM is "absolutely essential" in his new *ASSEMBLY COOKBOOK*. For entire Apple II family including the new Apple //c (with all the new opcodes). **SOURCE CODE** available for an additional \$30.00

LOW LOW PRICE !!! C-PRINT For The APPLE //c : \$69.00

Connect standard parallel printers to an Apple //c. C-PRINT is a hardware accessory that plugs into the standard Apple //c printer serial port. The other end plugs into any printer having a standard 36 pin centronics-type parallel connector. Just plug in and print! High speed data transfer at 9600 Baud. No need to reconfigure serial port or load software drivers for text printing.

FONT DOWNLOADER & EDITOR : \$39.00

Turn your printer into a custom typesetter. Downloaded characters remain active while printer is powered. Use with any Word Processor program capable of sending ESC and control codes to printer. Switch back and forth easily between standard and custom fonts. All special printer functions (like expanded, compressed etc.) apply to custom fonts. Full HIRES screen editor lets you create your own characters and special graphics symbols. Compatible with many parallel printer I/F cards. User driver option provided. For Apple II, II+, //e. Specify printer: Apple Dot Matrix, C.Itoh 8510A (Prowriter), Epson FX 80/100, or OkiData 92/93.

The Font Downloader & Editor for the Apple Imagewriter Printer. For use with Apple II, II+, //e (with SuperSerial card) and the new Apple //c (with builtin serial interface).

FONT LIBRARY DISKETTE #1 : \$19.00 Contains lots of user-contributed fonts for all printers supported by the Font Downloader & Editor. Specify printer with order.

The 'PERFORMER' CARD : \$39.00

Plugs into any slot to convert a 'dumb' centronics-type printer I/F card into a 'smart' one. Command menu eliminates need to remember complicated ESC codes. Features include perforation skip, auto page numbering with date & title. Includes large HIRES graphics & text screen dumps. Specify printer: MX-80 with Grafbtrax-80, MX-100, MX-80/100 with Grafbtraxplus, NEC 8092A, C.Itoh 8510 (Prowriter), OkiData 82A/83A with Okigraph & OkiData 92/93. **SOURCE CODE : \$30.00**

FIRMWARE FOR APPLE-CAT: The 'MIRROR' ROM : \$25.00

Communications ROM plugs directly into Novation's Apple-Cat Modem card. Basic modes: Dumb Terminal, Remote Console & Programmable Modem. Features include: selectable pulse or tone dialing, true dialtone detection, audible ring detect, ring-back, printer buffer, 80 col card & shift key mod support. Uses superset of Apple's Comm card and Micromodem II commands. **SOURCE CODE : \$50.00**

RAM/ROM DEVELOPMENT BOARD : \$30.00

Plugs into any Apple slot. Holds one user-supplied 2Kx8 memory chip (6116 type RAM for program development or 2716 EPROM to keep your favorite routines on-line). Maps into \$Cn00-CnFF and \$C800-CFFF.

ALL NEW !!! MIDI MUSIC PRODUCTS

MIDI means Musical Instrument Digital Interface. Use your computer with any MIDI-equipped music keyboard for entertainment and music education. Low cost MIDI player interface cable, complete with 6 song demo disk: \$49.00. Thousands of popular songs available soon on diskette (also compatible with Passport MIDI interface). Products for both the Apple IIc and Commodore 64/128. Unique general purpose MIDI expander cable and gender changer also available. Send SASE for product descriptions and prices.

Avoid a \$3.00 handling charge by enclosing full payment with order. VISA/MC and COD phone orders accepted.

8086/8088 Cross Assembler

Use your Apple to learn 8086 programming! You can program for the IBM PC, the clones, and ALP's co-processor board without ever leaving the friendly environment of Apple DOS 3.3.

This easy-to-use cross assembler, based on the S-C Assembler II (Version 4.0), covers all the 8086 and 8088 instructions and all the addressing modes. Instruction mnemonics are based on the Microsoft 8086 assembler. Does not include newer S-C Assembler features like macros or the EDIT command.

Documentation covers the differences from standard S-C Assembler operation and syntax. Sample source programs help you become familiar with the assembler syntax.

With permission from S-C Software, XSM 8086/8088 is available to owners of any S-C Assembler for \$80.00 post-paid. (No credit cards or purchase orders.)

APPLIED ENGINEERING

To a World of Compromise, We Make No Contribution

THE NEW TIMEMASTER II H.O.

- Absolutely, positively, totally PRO-DOS and DOS 3.3 compatible.
- Time in hours, minutes, seconds and milliseconds (the ONLY PRO-DOS compatible card with millisecond compatibility).
- 24 hour military format or 12 hour with AM/PM format.
- Date with year, month, day of week and leap year.
- Eight software controlled interrupts so you can run two programs at the same time (many examples are included).
- The only card recognized by both the

H.O.	PRO-DOS (COMPATIBLE)	INCLUDES DOS DATE	MILLISECOND TIME	YEAR DATA	LARGEST SAMPLE SOFTWARE	REMOTE SET POINT	BSR PORT	EMULATES ALL OTHER CLOCKS
BRAND A	YES	YES	YES	YES	YES	YES	YES	YES
BRAND B	YES	YES	YES	YES	YES	YES	YES	YES
BRAND C	YES	YES	YES	YES	YES	YES	YES	YES
BRAND D	YES	YES	YES	YES	YES	YES	YES	YES
BRAND E	YES	YES	YES	YES	YES	YES	YES	YES
BRAND F	YES	YES	YES	YES	YES	YES	YES	YES
BRAND G	YES	YES	YES	YES	YES	YES	YES	YES
BRAND H	YES	YES	YES	YES	YES	YES	YES	YES

Full emulation of all other clocks. Yes, we emulate Brand A, Brand T, Brand P, Brand C, Brand S and Brand M too. It's easy for the H.O. to emulate other clocks, we just drop off features. That's why the H.O. can emulate others, but none of the others emulate us. The Timemaster II H.O. will automatically emulate the correct clock card for the software you're using. You can also give the H.O. a simple command to tell which clock to emulate. This is great for writing programs for those poor unfortunates who bought some other clock card.

REMOTE CONTROL

Our BSR X-10 interface option for the H.O. allows you to remotely control up to 16 lights and electrical appliances through your BSR X-10 home control system in your home or office. You're already wired because a BSR system sends its signals over regular 120 volt wiring. That means you can control any electrical device in your home or office without additional wiring.

PRICE \$129.00 BSR Option (may be added later) \$49.00

VIEWMASTER 80

There used to be about a dozen 80 column cards for the Apple. Now there is only ONE.

- TOTALLY Videx Compatible.
- 80 characters by 24 lines, with a sharp 7x9 dot matrix.
- On-board 40/80 soft video switch with manual 40 column override.
- Fully compatible with ALL Apple languages and software—there are NO exceptions.
- Low power consumption through the use of CMOS devices.
- All connections are made with standard video connectors.
- Both upper and lower characters are standard.
- All new design (using a new Microprocessor based C.R.T. controller) for a beautiful razor sharp display.
- The VIEWMASTER incorporates all the features of all other 80 column cards, plus many new improvements.

PRICE	BUILT-IN SOFTWARE	SHIFT KEY SUPPORT	LOW POWER MODE	40 COLUMN MODE	YES DET. JABBER	LIGHT P.W. INPUT	40 COLUMN OVERDRIVE	INVERSE CHARACTER

VISUMASTER 80	NO	YES	NO	NO	NO	NO	NO	NO
SMARTVIEW	NO	YES	NO	NO	NO	NO	NO	NO
VISTA	NO	YES	NO	NO	NO	NO	NO	NO

The VIEWMASTER 80 works with all 80 column applications including CP/M, Pascal, WordStar, Format II, Easywriter, Apple Writer II, VisiCalc, and all others. The VIEWMASTER 80 is THE MOST compatible 80 column card you can buy at ANY price!

PRICE \$139.00

Z-80 PLUS

Now Includes New 4.0™ Software

Enter the CP/M world with the new Z-80 Plus card from Applied Engineering and introduce your Apple to thousands of new programs. Only the Z-80 Plus comes standard with the new 4.0 software, the most advanced system for running CP/M programs ever. Only CP/M 4.0™ has advanced features like built-in disk emulation for popular memory expansion boards (those made by Apple and Applied Engineering and others) to give you a faster system with more storage. You also get menu driven utilities that are much easier to use than the older CP/M utilities so you can get down to all that great CP/M software faster. If you already own the Z-80 Plus, you can upgrade to the 4.0 software for only \$29. The Z-80 Plus runs older CP/M programs too, down to Version 1.6 (2.2 is the most popular). With the Z-80 Plus you can run the largest body of software in existence. Simply plug the Z-80 Plus into any slot in your Apple. You'll have two computers in one and the advantages of both, all at an unbelievably low price.

- TOTALLY compatible with ALL CP/M software.
- The only Z-80 card with a special 2K "CP/M detector" chip.
- Fully compatible with microsoft disks (no pre-boot required).
- Specifically designed for high speed operation in the Apple IIe (runs just as fast in the II+ and Franklin).
- Runs WORD STAR, dBASE II, TURBO PASCAL, FORTRAN-80, PEACHTREE and ALL other CP/M software with no pre-boot.
- A semi-custom I.C. and low parts count allows the Z-80 Plus to fly thru CP/M programs at a very low power level. (We use the Z-80A at a fast 4MHZ.)
- Does EVERYTHING the other Z-80 boards do, plus Z-80 interrupts.

PRICE \$139.00

SUPER MUSIC SYNTHESIZER — END MOCKINGBOREDOM

- Complete 16 voice stereo music synthesizer on one card. Just plug it into your Apple, connect the audio cable (supplied) to your stereo, boot the disk supplied and you are ready to input and play songs.
- It's easy to program music with our compose software. You will start right away by inputting your favorite songs. The Hi-Res screen shows what you have entered in standard sheet music format.
- Now with new improved software for the easiest and the fastest music input system available anywhere.
- We gives you lots of software. In addition to Compose and Play

- programs, 2 disks are filled with over 30 songs ready to play.
- Easy to program in Basic to generate complex sound effects. Now your games can have explosions, phaser zaps, train whistles, death cries. You name it, this card can do it.
- Four white noise generators which are great for sound effects.
- Full control of attack, volume, decay, sustain and release.
- Our card will play notes from 30HZ to beyond human hearing.
- Automatic shutoff on power-up or if reset is pushed.
- Many many more features.
- Works in any slot of a IIe or II+ including slot 3 of a IIe.

PRICE \$159.00

Our boards are far superior to most of the consumer electronics made today. All I.C.'s are in high quality sockets with mil-spec. components used throughout. P.C. boards are glass-epoxy with gold contacts. Made in America to be the best in the world. All products work in Apple IIe, II, II+ and Franklin. Applied Engineering also manufactures a full line of data acquisition and control products for the Apple, A/D converters and digital I/O cards, etc. Please call for more information. All our products are fully tested with complete documentation and available for immediate delivery. All products are guaranteed with a no hassle THREE YEAR WARRANTY.

Call (214) 492-2927, 9 a.m. to 11 p.m. 7 days a week or send check or money order to P.O. Box 798, Carrollton, Texas 75006. MasterCard, Visa and C.O.D. welcome. No extra charge for credit cards. Texas residents add 5% sales tax. Add \$10.00 if outside U.S.A.

Is the Apple II a slow machine? Hey, it MUST be! After all, it is over 8 years old! It only has an 8-bit microprocessor! It only has a 1-MHz clock! It must be many times slower than today's PC clones, etc. Isn't it?

No.

The 6502 is inherently faster than most other microprocessors. An old rule of thumb had it that a 4-MHz Z-80 ran roughly the same speed as a 1-MHz 6502. Other factors, such as memory speeds, overhead for screen and keyboard, and disk I/O also influence the overall speed, often in favor of the venerable Apple

Some comparisons come to mind with machines from the past. Anyone remember MIT's "Whirlwind"? A long time ago, its speed was considered super. I'll bet it wasn't as fast as an Apple. According to the book, it had an upper limit of 2048 16-bit words of "high-speed" memory, and had a design limit of 50,000 instructions per second. In actual implementation, it only ever achieved 20,000 operations per second. And that was with a 1 MHz clock! The 6502 with a 1 MHz clock runs from 500,000 to 142,000 operations per second, depending on which ones you are doing. Probably an average of 250,000.

How about the Bendix G-15? It was the "personal" computer of the 1950's, roughly the size of a large refrigerator (much warmer though) and selling for only \$50,000. Engineering firms bought them eagerly for their friendly features, amazing flexibility, capacity, and speed. Let's see.... G-15 had 2183 words of RAM, on a magnetic drum. 29 bits per word. Most operations were measured in milliseconds. A floating point interpretive package, called Intercom 500 (or 1000 for double precision), could almost keep up with the typewriter (an IBM Executive, the primary user I/O device). Paper tape cassettes served as handy off-line storage devices.

Some other popular systems were considered fast with memory cycle times over ten microseconds per byte. Fast enough to support several users in a timesharing environment, compile large Fortran programs, and manage large businesses. And usually with smaller than 128K bytes of RAM. Or "core", as we called it in those days.

Nevertheless, Apples often seem slow. Because we ask them to do a lot, and don't want to wait around while it is done. And tolerable waiting times one day seem intolerable the next, because we get used to it. Remember when a trip around the world in 80 days seemed impossibly fast?

Perceived necessity being a prime motivator for innovation, several methods for dramatically accelerating Apples have been developed. Titan Technologies markets the Accelerator, and Microcomputer Technologies (MCT) the SpeedDemon. These both promise "up to" 3 5 times faster running speed, and actually deliver an average of over 2 times faster.

NEW DON LANCASTER RELEASES

Available **ONLY** from Synergetics. All software open and unlocked.

ABSOLUTE RESET (IIC/old IIE/new IIE) \$19.50

Get back in total control. No more hole blasting! Access any part of any program at any time for any reason. Passes all diagnostics. Invisible till activated. Includes EPROM burner adapter details, service listings, and a free bonus book.

APPLEWRITER™ TOOLKITS (DOS 3.3 or ProDOS) \$39.50

EIGHT diskette sides include a complete disassembly script; source code capturing; self-prompting glossaries; Diablo microjustify and proportional space, patches including NULL, shortline, Grappler, IIC detranshing, many others; answers to most help line questions; two columns; WPL secrets; space on disk; keyword indexing; multi and even-odd headers; bunches more.

Both TOOLKITS (sixteen disk sides) \$59.50

APPLEWORKS™ DISASSEMBLY SCRIPT \$49.50

TEN diskette sides chock full of Applework's innermost secrets, using Don's unique and powerful "tearing method". Primarily for gonzo hackers and definitely NOT for the faint of heart.

LASERWRITER/APPLEWRITER UTILITIES \$39.50

Two volume package gives you unmatchably superb IIE text and graphics. Included are automatic formatters, boxes and fancy borders, daisywheel changers, envelope and label routines, unbelievably fast formletters, grids and rulers, HIRES converters, DC1 patches, demos, justify routines, self-prompting glossaries, help screens, a sign shop, outlined text, more.

AUTOGRAPHED LANCASTER BOOKS:

Apple IIE Assembly Cookbook	\$21.50
All About Applewriter IIE	\$14.50
Enhancing Your Apple II & IIE, (Volume I or II)	\$15.50
Micro Cookbook (Volume I or II)	\$15.50
CMOS Cookbook	\$14.50
TTL Cookbook	\$12.50
Incredible Secret Money Machine	\$7.50
Complete book and software list	(FREE)

COMPANION DISKETTES:

For Enhancing Your Apple II, Volume I	\$19.50
For Enhancing Your Apple II, Volume II	\$19.50
For Don Lancaster's Assembly Cookbook	\$19.50

We have wanted to try one of these boards for years. The price was too high and our faith too low, so we never bought one. Recently the price has dropped considerably, and reports from friends using them have increased our faith. When MCT offered to loan us one for a month, we had no more resistance at all.

Imagine this scenario: the card arrives by UPS at noon. Thirty seconds later we have it in our hands, and are trying to find an Apple with at least one empty slot. Despairing of that, we take out a card and make room for the SpeedDemon in our //e. We turn on the //e, load up the S-C Macro Assembler, and proceed to assemble the biggest program we have. Wow! That's fast!

We promptly ran a lot of speed tests, timing various programs we commonly use around here:

S-C Word Processor			
Load 89 sectors	6 8	5.5	1.2
Search /###/	10.4	3 3	3.2
Replace /85/##/	8.3	2.8	3 0

Mail Label System (primarily Applesoft)			
Load 48 sectors	23.7	13.8	1.7
Sort - last name	140.6	49.1	2.9
Sort - zip code	56.0	20.0	2.8

S-C Macro Assembler			
Assemble 771 lines	7.2	3.0	2.4

AppleWorks Data Base			
Load 47K	25.7	25.0	1.0+
Sort - last name	2.2	1.0	2.2
Sort - zip code	5.0	2.0	2.5

AppleWorks Spreadsheet			
Load 35K	20.3	19.3	1.1
Recalculate	14.9	6 6	2.3
Insert 9 rows	4.9	1 8	2.7

In a review by Lee The, Personal Computing, Jan 85, the Apple with SpeedDemon was compared to a Compaq PC. Lee compared the systems using word processors on the two machines. The accelerated Apple ran faster in most cases, except when disk I/O was involved. In one case, even an un-accelerated Apple ran faster; the SpeedDemon to Compaq ratio was 4.4!

To summarize, the SpeedDemon really does make your software run faster. The absolute maximum speedup factor is 3.5, but no "real" program would achieve it. The two things that keep you from reaching 3.5 are I/O and memory.

Some I/O cards, notably the disk interface, use software timing. If you speed up the processor while trying to read or write the disk, you are in trouble. SpeedDemon automatically slows down to normal Apple speed when you access slot 6. Jumpers on the card allow you to do the same for slots 4 and 5.

I have a disk controller in slot 7 in one of my Apples; I cannot read or write to disks using that controller when the SpeedDemon is active.

Old Apple serial interface cards used software timing loops to convert a byte to a bit stream at a given baud rate. These cards normally were placed in slots 1 or 2, and thus would not be compatible with the SpeedDemon. Modem cards sometimes use software timing for dialing, and they would not work right if accelerated. Any sound effects created through the Apple speaker will be raised way up in pitch. Music cards which depend on timing loops will make a whole new kind of sound.

The card can be turned off in two ways, so the above problem areas can be circumvented. During the power up cycle you have about two seconds during which you may tap the ESCAPE key. If you do, the card will be turned off. Then you hit ctrl-RESET to go into a normal boot. Another way to turn off the card is to store anything into \$C05B (POKE 49243,0). After the POKE the Apple will lock up; when you hit ctrl-RESET it will come back in normal speed. There is no way to turn the card back on without turning off the Apple. (Some of you can probably find a way to re-wire it so it could be turned back on.)

The other way the card slows down is during memory access. Apple memory can only be accessed at a 1 MHz rate, so the processor can spend time waiting for memory. SpeedDemon has a 4096-byte cache memory which can run at a full 3.58 MHz rate. The cache is implemented with 4 static RAM chips, providing 8192 bytes of RAM. These are paired so that you get 4096 data bytes and 4096 address bytes. Whenever you read a byte from RAM or ROM, the low-order 12 bits of the address select one of these 4096 byte pairs. The high 4 bits of the address are compared to the 4 bits in the cache; if they are the same then the data in the cache is presumed to be the data you want. If not, the processor will wait for Apple's memory to read, and then update the cache with the result. Something like that, anyway. Stores into memory always slow down to a 1 MHz rate, because the stores MUST be performed in real RAM, not just cache RAM.

I might have been talking through my hat in the above paragraph. There is no technical documentation available on the SpeedDemon, so I am just deducing the way it works from external appearances.

The Titan Accelerator card has a full 64K RAM, rather than a cache. It is therefore a little bit faster. Reports from those who have tried both indicate Titan is only about 10 percent faster, if that much. Of course you could design artificial situations in which the difference would be much more dramatic. Personally I think I would rather have the cache. And also the cash, since SpeedDemon costs about \$25 less.

Titan's card draws about 300 ma at 5 volts, SpeedDemon draws about 600 ma. Titan's card uses more CMOS, and is more sensitive to static electricity.

SpeedDemon uses a 65C02, so you have the additional opcodes and address modes of this enhanced 6502 chip available. I believe you could remove the 65C02 plug a 65802 into the socket and gain even greater enhancements. You would have to have a 65802 rated at 4MHz, but the ones I have are only 2 MHz chips.

There are five PLA's on the SpeedDemon. At least some of these are used to keep track of whatever bank switching you do with Apple's RAM and ROM. Somehow they are able to keep track of the RAMWORKS card too, so the cache doesn't get confused even with a megabyte of RAM. I worry about using it with my STB128 card, or the other cards of the type. Boards which store into Apple RAM using DMA transfer will possibly give trouble. I don't know for certain because I don't have any.

I also worried about compatibility with QuikLoader. Both QL and SD want to take control of the bus on power up or reset. Both substitute their own firmware for whatever is plugged into the mother board. Sure enough, when I tried them both in the same machine they did not work. On power up both cpu's began to operate. SD drew its hi-res graphic logo, and then died. QL died too. Take either card out, and all is well.

Speaking of firmware, I should mention that there is a 2716 with 2K of firmware on the SpeedDemon. When you power up or hit ctrl-RESET the firmware on the card takes control. It sets a bunch of //e soft switches, in case it is in a //e, and then looks at the power-up bytes to see whether this is a RESET or power up. (Remember the power up bytes at \$3F3 and \$3F4? These bytes will be random when you first turn on your Apple, but during initialization they are set so that the exclusive-or of the two bytes is \$A5.) If SpeedDemon thinks you have pressed ctrl-RESET, it copies a short (21-byte) program from its own ROM down to \$1D0 and jumps to it. The program turns off the SpeedDemon ROM (by storing at \$C800) and then uses a loop to make sure the cache doesn't contain misleading information (I call this action TRASHING the CACHE). Then it jumps to Apple's normal reset code.

If SpeedDemon thinks it is power-up time, because the "eor" the bytes at \$3F3 and \$3F4 is not \$A5, it trashes the cache and copies a large program down to RAM at \$1000 through \$17FF. Then it trashes the cache again, clears the text screen, and jumps to \$1000. The copied code at \$1000 turns off the firmware ROM, clears the hi-res screen, switches on hi-res graphics, and draws the SpeedDemon logo. This all takes about two seconds. Then it reads the keyboard to see whether you have typed an ESCAPE, a "l", or a "T". ESCAPE signals SpeedDemon you want to run at normal Apple speed, so it shuts itself off. The other codes cause self-testing code to be executed.

I had a lot of fun figuring out the firmware. It so happens they purposely arranged all the bits in the EPROM in reverse order, so that I had to write a program to flip the bytes around before disassembling the code. I guess it was an attempt to frustrate reverse engineering. I think they should

12 Good Reasons Why RAMWORKS™ Is The Best Expansion Card For Your IIe

1 APPLEWORKS MEMORY Even though Ramworks enhances and expands a VAST ARRAY of other programs, Appleworks is our claim to fame. A 64K Ramworks will ADD 46K to your available desktop memory, a 128K Ramworks will ADD 91K, a 256K Ramworks will ADD 182K, and a 512K Ramworks will ADD 364K and a 1 meg Ramworks will give you nearly an 800K desktop. And it's all done automatically! When you plug in more memory chips into your Ramworks card, Appleworks will find them automatically. Ramworks also increases the maximum number of records from 1350 to 4300.

2 APPLEWORKS SPEED AND POWER Ramworks does more than just increase the desktop memory (as if that weren't enough). With Ramworks, Appleworks will be able to run up to 20 times faster. If you buy a 256K or larger Ramworks card, Appleworks will automatically load itself in Ramworks. This greatly increases the speed at which Appleworks operates by eliminating all that nasty, time consuming disk access on Drive 1. These are but a few reasons why we say that Ramworks is Appleworks best friend.

3 EXPANDABILITY Ramworks was designed with the future in mind, as your needs increase, so can Ramworks. Clear instructions show you how to plug in more memory (up to 1 meg).

4 SPEED Today, as programs become more and more sophisticated, they inevitably become larger. And many of today's best selling programs (like Appleworks) won't fit in a 128K Apple, so many of these new larger programs continually go back to disk in search of more data. With Ramworks, you can have enough memory so that the entire program will be loaded into Ramworks' memory. This greatly increases the speed of software because your disk runs at 300 RPM, but Ramworks operates at the speed of light!

5 COLOR The same slot that's used for memory expansion is also the slot that's used for RGB color display, so all those lesser memory cards of yesterday make you decide in advance if you want RGB color. Only Ramworks lets you decide later to add RGB color. For only \$129, an RGB option can be added to Ramworks to give you double high resolution color graphics and 80 column text. All with a razor sharp, vivid brilliance that's unsurpassed in the industry. The RGB option does not waste another valuable slot, but rather plugs into the back of Ramworks and attaches to any Apple compatible monitor. Remember, you can order the RGB option with your Ramworks or add it on at a later date.

6 COMPATIBILITY, OF THE SOFTWARE KIND Programs like Appleworks, Magic Office System, Flashcalc, The Spread Sheet, Diverse-A-Dos, Supercalc, Magicle and many others automatically recognize all or most of Ramworks' memory (512K is average). The simple fact is that Ramworks is compatible with more off-the-shelf software than any other RAM card. Ramworks is 100% compatible with ALL software written for the Apple 80 column and extended 80 column card. Additionally, Ramworks can emulate other RAM cards so software written for other cards will run without modification. Software written for RAMWORKS will not work on other cards. We can emulate others, but others can't emulate us.

7 COMPATIBILITY, OF THE HARDWARE KIND Unlike others, Ramworks is fully compatible with hardware add-ons from other companies, like the Sider and Profile hard disks. And Ramworks was designed in accordance with the official expansion rules defined by Apple so you don't have to worry about compatibility problems. As you continue to expand and make your Apple more powerful with other expansion products from Applied Engineering, you'll appreciate how each product has extra features designed to work with Ramworks and other products to give you a total performance package that is more powerful than the sum of its parts.

8 IT SELLS THE MOST Popularity translates into great software support because software companies can't support all RAM cards, they can only support the ones their customers are likely to own. And software companies appreciate the fact that when they write software for Ramworks in the IIe,

they're also writing software for our memory expansion card for the IIc, Z-RAM. And our customer list reads like the Who's Who of Apple computing with just about every software company in the land buying one, including Apple Computer (in the hundreds), Rupert Lissner, and Steve Wozniak (we didn't give one to Mr. Wozniak just to use his name. 2 one meg Ramworks were paid for at full price).

9 IT'S FROM APPLIED ENGINEERING Unlike most of the competition, we only make accessories for Apple, so we'll never spend your money on IBM product research. Applied Engineering's years of experience and wide product line really pays off, and because of our high sales levels we buy most of our L.C. chips factory direct. So don't let our low prices fool you, they're caused by high volume production. That's why we can offer the most memory for the least money. Guaranteed!

10 IT'S GOT IT ALL

- ✓ Sharp 80 Column Text
- ✓ Double high resolution graphics (with or without RGB option)
- ✓ User Expandable to 1 Megabyte
- ✓ Can Use 64K or 256K RAMS in any combination
- ✓ Adds Memory to Appleworks
- ✓ Accelerates Appleworks
- ✓ 100% Compatibility with All IIe software
- ✓ RAM Disk software available, compatible with Applesoft, PRO-DOS, DOS 3.3, and PASCAL (\$29)
- ✓ RAM Disk available for CP/M (\$29). (This program is included with our CP/M card)
- ✓ Visicalc preboot available (\$29)
- ✓ RGB option
- ✓ Takes only one slot
- ✓ 3 year no hassle warranty

11 THE PATENT OFFICE HAS ONE There are many advanced features on Ramworks, but two parts of the design are so advanced we applied for patents. One patent application deals with our ultra fast, ultra smooth 80 column screen display, and the other patent application deals with our ingenious way of dramatically reducing the power and heat of memory chips and improving reliability at the same time.

12 HERE TODAY, HERE TOMORROW In the seven years we've been making products for the Apple, we've seen a lot of companies come and go. Although nothing is forever, we're growing, expanding and we're profitable. And we are totally committed to Apple computing, which means you'll never run out of things to do with Ramworks. Or for that matter, reasons to buy one.

Ramworks™ with 64K	\$179
Ramworks™ with 128K	\$249
Ramworks™ with 256K	\$299
Ramworks™ with 512K	\$399
Ramworks™ with 1 MEG	\$649
RGB Option (can be added later)	\$129

Call (214) 241-6060

9 a.m. to 11 p.m. - days a week or send check or money order to: Applied Engineering, P. O. Box 798, Carrollton, Texas 75006

MasterCard Visa and C.O.D. welcome. No extra charge for credit cards. Texas Residents add 5% sales tax. Add \$10.00 if outside U.S.A.

AE APPLIED ENGINEERING
"We Set the Standard"

have re-arranged the address lines too, if they really are worried about it.

If all the above makes you want to rush right out and buy one, the price is \$295 from Microcomputer Technologies (McT), at 1745 21st St., Santa Monica, CA 90404. Their phone number is (213) 829-3641. If you are a member of Call APPLE, they are selling the SpeedDemon card for only \$199. The name on the card has been changed to "Mach 3.5", but it is the same as SpeedDemon. Call them at (206) 251-5222. Since the Call APPLE price is as close to wholesale price as we can get, we will not be trying to sell this board at S-C Software.

By the way, Call APPLE's ad contains a warning: "Mach 3.5 is not compatible in speedup mode with Saturn, Legend, Prometheus expansion memory cards with programs that make use of the extra banks on these cards. A compatible version of Mach 3.5 may be specially ordered."

IF YOU HAVE A HARDWARE DESIGN FOR THE APPLE, APPLIED ENGINEERING PAYS TOP DOLLAR FOR GOOD HARDWARE DESIGNS.

Last week I looked through some old piles of papers and came across a program by Greg Seitz, dated Dec 20, 1983. It was attached to a set of ProDOS Tech Notes, and Greg apparently worked at Apple at that time.

Greg's program lists the filenames of an entire ProDOS directory, showing the whole tree. It shows directory files by printing a slash in front of the filename, and shows the level by indenting. For example, a typical listing might look like this:

```
PRODOS
BASIC.SYSTEM
/UTILITIES
  HELPER
  DOER
/MORE
  WHATEVER
  AND.ANOTHER
  TEXT.FILE
  ANOTHER
```

A listing like this can be a big help in finding things on a large hard disk. The program can also be extended in many ways. One that comes to mind immediately is to print the rest of the CATALOG information as well as the file names. Another is to create a complete CATALOG MANAGER utility, which would permit re-arranging the filenames, promoting and demoting files, and so on.

I typed in Greg's program, and then I rewrote it. The listing that follows bears very little resemblance to his code, but I do thank him for the help in getting started.

The program assumes a prefix has been set. If there is no prefix, you will get a beep and no listing. If there is a prefix, and the directory named is online, the listing will begin with that directory. Another enhancement would be to display the current prefix, and allow accepting it or changing it before starting the filename listing.

If we were always starting with the volume directory, it would be a little easier. The volume directory always starts in block 2. However, since we are able to start with any directory, we do not know where it starts. ProDOS allows you to read a directory, and we can get the first block of any directory by using MLI to open the directory file.

Lines 1100-1120 read the current prefix into a buffer. The lines 1130-1150 open that file. Although I have never seen it in the books, apparently OPEN also reads the first block. After the OPEN call, BUFFER ONE contains the first block of the directory file. Unless we are willing to do a complete search without ProDOS's help, this is the only way I know of to find the first block of a directory file (other than the volume directory).

Since the only reason to OPEN the directory file was to read the first block, lines 1180-1200 close it again. If any of these MLI calls don't go through, line 1210 will ring the alarm and stop.

Lines 1230-1260 start up the directory listing. The first block ONLY will be in BUFFER.ONE. All subsequent blocks will be read into BUFFER.TWO. In order to make the LIST.DIRECTORY program completely recursive, it is called with the buffer address in a zero-page pointer. SETUP.NEXT.BLOCK also gets the next block pointer from the buffer and saves it in NEXT.BLOCK.

LIST.DIRECTORY is really quite simple, in spite of its size. Its main function is to print a list of filenames. Each filename is preceded by a number of blanks, determined by NEST.LEVEL. NEST.LEVEL is incremented at line 1290, each time LIST.DIRECTORY is called. If a file listed happens to be a directory file, LIST.DIRECTORY saves all the pointers and counters on the stack and then calls itself. When the subdirectory's files have all been listed, that recursive call of LIST.DIRECTORY will return, the pointers and counters can be unstacked, and the listing can continue.

The format of the information in a directory is detailed quite well in both "Beneath Apple ProDOS" and "Apple ProDOS Advanced Features". (We recommend and sell both books.) The first four bytes of each block are two block numbers: that of the previous block, and that of the next block, in the same directory. This allows scanning in both forward and reverse directions through a directory. We will only use the next-block pointers in our program. After the block numbers there are 13 descriptors of 39 bytes each. The first descriptor in a directory describes the directory itself, and the rest describe files.

For some reason Apple was not quite sure that it would always use 13 39-byte descriptors, so they stored these two numbers in the directory descriptor. Anyone who access a directory is supposed to look up these two numbers and use them, just in case Apple decides to change them someday. The directory descriptor also contains an active file count. When a file is deleted this count is decremented, but the file descriptor remains. We use the active file count to determine when we reach the end of a directory. Lines 1300-1360 pick up the bytes per descriptor, descriptors per block, and active file count and save them

Lines 1370-1450 set up PNTR to point at the first file descriptor, which follows the directory header. CURRENT.ENTRY.NUMBER will count up to 13, so we will know when it is time to read another block. We start at 2, because the first block uses the first descriptor for the header. We also clear the file count.

Lines 1460-1500 check for the special case of an empty directory. If there are no active files, we are finished.

Expanding Your IIC Is Easy With Z-RAM

Applied Engineering and Apple computer have teamed up to take your IIC to new heights.

Applied Engineering's Z-RAM card for the IIC is available with 256K or 512K of additional memory and a powerful Z-80 microprocessor for running CP/M software.

Z-RAM fits neatly inside the IIC. Installation is easy, clear instructions show you how. You'll need a screwdriver and about 10 minutes (if you can change a light bulb you can install Z-RAM).

Z-RAM and Appleworks will knock your socks off.

A 256K Z-RAM will give you a 229K available desktop and Appleworks will be completely loaded into memory. Appleworks will now run about 10 times faster in your IIC with 1 disk drive than in other IIC's with 2 disk drives. A 512K Z-RAM will give you a 413K available desktop. A 256K Z-RAM can be upgraded to 512K by just plugging in more memory chips.

Z-RAM is also a high speed solid state disk drive. With Z-RAM, your programs will load and save over 20 times faster. Z-RAM's RAM disk is compatible with Applesoft, ProDOS, DOS 3.3, PASCAL and CP/M. And with Z-RAM, you can copy a disk in one pass. Just insert the original, remove the original, insert blank disk! That's it! Z-RAM is another disk drive, only 20 times faster, 4 times larger capacity, and no whirring, clicking or waiting!

But before you start panting over all that extra memory, don't forget that the Z-RAM card has a built-in high speed Z-80 processor chip that allows you to run CP/M programs like Wordstar, dBASE II, Turbo PASCAL, Microsoft BASIC, FORTRAN and COBOL and over 3,000 other CP/M programs. So Z-RAM not only makes Apple programs run better and faster, it lets you run MORE programs.

With the Z-RAM card installed, your IIC is still your IIC only now you'll have that extra memory that Appleworks

and other programs need. And you can run all that great CP/M software that others can only dream about.

Z-RAM is 100% compatible with all IIC software and hardware including the mouse, 2nd disk, modem and printer. Z-RAM is easily handled by the IIC power supply as power consumption is kept very low by using two custom integrated circuits and a patent pending power saving design. And Z-RAM is from Applied Engineering, the acknowledged leader and innovator of accessories for the Apple.

Z-RAM comes complete with manual, RAM disk software, Z-80 operating system, CP/M manual and a 3 year no hassle warranty.

So the next time somebody asks you why you didn't get an IBM P.C., tell him you bought a IIC because the IBM didn't have enough memory and was too slow and couldn't run CP/M software. And tell him you made it past the 8th grade.

Z-RAM with 256K

\$449

Z-RAM with 512K

\$549

If you want to run CP/M software, but don't need more memory, may we suggest our Z-80c card. The Z-80c offers the same CP/M performance as Z-RAM but has no memory expansion ports. And the Z-80c will not affect the running of Apple programs. The Z-80c is priced at only \$159.00 and should you ever want to upgrade to Z-RAM, we'll refund your full purchase price.

AE
APPLIED ENGINEERING
"We Set the Standard"

Lines 1510-1750 print out the file name from the current file descriptor. The first byte of a descriptor contains a code for the type of file in the first nybble, and the length of the file name in the second nybble. If both are zero, the file has been deleted. The other legal values are \$1x, \$2x, and \$3x to signify a seedling, sapling, or tree file, respectively; and \$Dx to signify a directory file. All we care about is whether is a directory file or not, and how long the file name is.

If it is a directory file, lines 1760-2100 will be executed. Lines 1760-1860 push the counters and pointers on the stack. Lines 1870-1930 read in the first block of the sub-directory. Line 1950 calls LIST.DIRECTORY to list the subdirectory. After it is finished, line 1960 will decrement the nesting level. Lines 1970-2060 unstack the pointers and counters. If we were still in the first block of the highest level directory (where we started), we do not need to read the block again: it is still in BUFFER.ONE. Otherwise, lines 2070-2100 read the block back in. If we did not care how much memory we used, we could make this program a lot faster by using more buffers. We could have a different buffer for each level, so that blocks would never have to be re-read.

Lines 2110-2210 count the file just listed, and then check to see if our count is the same as the active file count from the directory header. If so, we are finished.

If we are not finished, lines 2220-2290 bump the pointer into the directory block by the size of a descriptor entry. If we are still in the same block, that is all that we need to do. If not, lines 2350-2420 read in the next block and set things up for it. Then it's back to the top again for the next file name!

We hope some time in the not-so-distant future to be able to write a complete catalog manager program like I started to describe back at the beginning of this article. Some of you are using Bill Morgan's CATALOG ARRANGER for DOS 3.3, and this would be an equivalent utility for ProDOS. We're not quite ready yet, but this program is a step in the right direction.

If You Have
APPLEWORKS™
 It's Easy To Tell If You
 Have A Timemaster H.O. Clock
 In Your Apple

Just Look Right Here

Only the Timemaster H.O. displays the date and time on the Appleworks screen.* If you don't have a Timemaster H.O., you'll just get the help key reminder. The Timemaster H.O. will also automatically time and date stamp your files on disk. And don't forget, the Timemaster H.O. has all the features of all the competition combined, including year, leap year (not just in PRO-DOS), month, date, day, hours, minutes, seconds and milliseconds. The Timemaster H.O. is compatible with PRO-DOS, DOS 3.3, PASCAL and CP/M. And the Timemaster H.O. automatically emulates all other clock cards so you won't have any compatibility problems because the Timemaster H.O. works with ANY program that reads ANY clock.

In fact, you could put ALL the competitive cards in every slot in your Apple and you still wouldn't have all the features of the Timemaster H.O.

The Timemaster H.O. comes with a ton of fun and useful software. It has an easy to read yet detailed manual, a 20 year auto-recharging battery and a 3 year no hassle warranty.

TIMEMASTER H.O.

**SIMPLY PUT,
 IT'S SIMPLY THE BEST**

\$129.00 Complete

*If you purchased a Timemaster H.O. prior to AppleWorks support, an easy to use patch program is available for \$20.00.

Allow BSAVE to New Non-Binary Files in BASIC.SYSTEM 1.1
.....Mark Jackson
Chicago, Illinois

I consider it a bug: BASIC.SYSTEM doesn't allow BSAVEing to a new file unless the type is binary. Yet it is equally desirable to be able to BSAVE to non-binary files without first CREATEing them.

I discovered this problem while implementing FIG-FORTH in ProDOS when I wanted to save the data blocks using as little code as possible. and at the same time allow use of standard text-file word processors.

BSAVEing would solve the code length problem, but to make a text file I would have had to CREATE the file first, thus decreasing speed and increasing code length. Therefore I looked for the BSAVE code inside BASIC.SYSTEM to fix the bug.

As it comes from Apple. BASIC.SYSTEM's parser puts the specified type in \$BE6A and then the BSAVE processor places it there again. I used the space this redundant code took for my patch.

There seems to be no good reason for Apple to purposely prevent BSAVEing to new non-binary files, so I think my patch is both worthwhile and safe.

The following applies only to Apple's BASIC.SYSTEM version 1.1. which is the latest as far as I know. The addresses shown are the actual running position. If you want to patch the SYS file by BLOADing at A\$2000, then addresses \$ADxx will be at \$37xx and addresses \$AExx will be at \$38xx.

The following is in the CREATE code.

Now is:

```

AD41- A9 0F    LDA #$0F    DEFAULT SYS FILE
AD43- 8D 6A BE STA $BE6A    PUT IN GLOBAL PAGE

```

Change to:

AD41- A2 0F LDX #\$0F
AD43- 8E 6A BE STX \$BE6A

The following is in the BSAVE code, and is only reached if it is a new file:

Now is:

ADF5- A9 06 LDA #\$06
ADF7- 8D 6A BE STA \$BE6A
ADFA- 8D B8 BE STA \$BEB8
ADFD- AD 56 BE LDA \$BE56

Thanks to Don Worth and Pieter Lechner for their help in dis-assembling, through their book "Supplement to Beneath Apple ProDOS." (This is the book you get by sending in \$10 and a coupon from Beneath Apple ProDOS.)

Now you can monitor and control the world (or at least your part of it) with a little help from

APPLIED ENGINEERING

12 BIT, 16 CHANNEL PROGRAMMABLE GAIN A/D

- All new 1984 design incorporates the latest in state-of-art I.C. technologies.
- Complete 12 bit A/D converter, with an accuracy of 0.02%!
- 16 single ended channels (single ended means that your signals are measured against the Apple's GND.) or 8 differential channels. Most all the signals you will measure are single ended.
- 9 software programmable full scale ranges, any of the 16 channels can have any range at any time. Under program control, you can select any of the following ranges: ± 10 volts, ± 5 V, ± 2.5 V, ± 1.0 V, ± 500 MV, ± 250 MV, ± 100 MV, ± 50 MV, or ± 25 MV.
- Very fast conversion (25 micro seconds).
- Analog input resistance greater than 1,000,000 ohms.
- Laser-trimmed scaling resistors.
- Low power consumption through the use of CMOS devices.
- The user connector has +12 and -12 volts on it so you can power your sensors.
- Only elementary programming is required to use the A/D.
- The entire system is on one standard size plug in card that fits neatly inside the Apple.
- System includes sample programs on disk.

PRICE \$319

A few applications may include the monitoring of: ● flow, ● temperature, ● humidity, ● wind speed, ● wind direction, ● light intensity, ● pressure, ● RPM, ● soil moisture and many more.

A/D & D/A

- Single Pt. card
- 8 channels A/D
- 8 channels D/A
- Superfast conversion time
- Very easy programming
- Many analog ranges
- Manual contains sample applications

A/D SPECIFICATIONS

- 0.1% accuracy
- On-board memory
- Fast conversion (0.78 MS per channel)
- A/D process totally transparent to Apple (looks like memory)
- User programmable input ranges are 0 to 10 volts, 0 to 5, - 5 to +5, 2.5 to 12.5, 5 to 0, - 10 to 0.

The A/D process takes place on a continuous, channel sequencing basis. Data is automatically transferred to its proper location in the on-board RAM. No A/D converter could be easier to use.

D/A SPECIFICATIONS

- 0.1% accuracy
 - On-board memory
 - On-board output buffer amps can drive 5 K Ω
 - D/A process is totally transparent to the Apple (just poke the data)
 - Fast conversion (0.01 MS per channel)
 - User programmable output ranges are 0 to 5 volts and 0 to 10 volts.
- The D/A section contains 8 digital to analog converters, with output buffer amplifiers and all interface logic on a single card. On-card latches are provided for each of the eight D/A converters. No D/A converter could be easier to use. The on-board amplifiers are laser-trimmed during manufacture, thereby eliminating any requirement for off-set nulling.

PRICE \$199

SIGNAL CONDITIONER

Our 8 channel signal conditioner is designed for use with both our A/D converters. This board incorporates 8 F.E.T. op-amps, which allow almost any gain or offset. For example, an input signal that varies from 2.00 to 2.15 volts or a signal that varies from 0 to 50 mV can easily be converted to 0-10V output for the A/D.

The signal conditioner's outputs are on a high quality 16 pin gold I.C. socket that matches the one on the A/D's so a simple ribbon cable connects the two. The signal conditioner can be powered by your Apple or from an external supply.

FEATURES

- 4.5" square for standard card cage and 4 mounting holes for standard mounting. The signal conditioner does not plug into the Apple, it can be located up to 1/2 mile away from the A/D.
- 22 pin 156 spacing edge card input connector (extra connectors are easily available i.e. Radio Shack).
- Large bread board area.
- Full detailed schematic included.

PRICE \$79

I/O 32

- Provides 4, 8-Bit programmable I/O Ports
- Any of the 4 ports can be programmed as an input or an output port
- All I/O times are TTL (0-5 volt) compatible

Some applications include:

Burglar alarm, direction sensing, use with relays to turn on lights, sound buzzers, start motors, control tape recorders and printers, use with digital joystick.

PRICE \$89

Please see our other full page ad in this magazine for information on Applied Engineering's Timemaster Clock Card and other products for the Apple.

Our boards are far superior to most of the consumer electronics made today. All I.C.'s are in high quality sockets with mil-spec. components used throughout. P.C. boards are glass-epoxy with gold contacts. Made in America to be the best in the world. All products compatible with Apple II and IIe.

Applied Engineering's products are fully tested with complete documentation and available for immediate delivery. All products are guaranteed with a no hassle three year warranty.

In the May issue of AAL Bob S-C published my article "A New Catalog for Dos 3 3" - he failed to mention or take credit for the fact that he modified my routine and managed to leave a whopping 17 spare bytes - which is 16 more than I left. I was happy enough to have added the new features.

At the end of that article Bob S-C set the challenge to add the Disk Volume message back. However. I have another possible use for those 17 spare bytes - well at least 14 of them!

How about a single-key format control feature for the Catalog command? The user issues the CATALOG command normally; then one more keypress will select either a normal or double-barrelled Catalog display.

Once you install the following additional code, when you issue the CATALOG command the routine waits for a keypress. If you press "D" you get a double-barrelled Catalog listing for your 80-column card or printer. Any other keypress will result in the normal 40-column version.

The line numbers on the 14-byte routine which follows make the code fit into the listing from the May article.

```

                1320 CATALOG
AD98- 20 0C FD 1321      JSR MON RDKEY      await keypress
AD9B- 49 8E 1322      EOR #$8E  "D" ($C4) eor LSR ($4A)
AD9D- C9 4A 1323      CMP #$4A  if was "D", now LSR
AD9F- F0 02 1324      BEQ .0      ...it was "D"
ADA1- A9 38 1325      LDA #$38  SEC opcode
ADA3- 8D 21 AE 1326 .0      STA DBL.SWITCH  set option
.
.
.
                2010 DBL.SWITCH SEC
.
.
                2150      .BS 3      three free bytes.
```

The code above is of the deadly self-modifying variety, so beware.

Note that if you have version 2.0 of the S-C Macro Assembler, you can write line 1322 as EOR #"D"#\$4A if you wish.

Apple Assembly Line is published monthly by S-C SOFTWARE CORPORATION, P.O. Box 280300, Dallas, Texas 75228. Phone (214) 324-2050. Subscription rate is \$18 per year in the USA, sent Bulk Mail; add \$3 for First Class postage in USA, Canada. and Mexico; add \$14 postage for other countries. Back issues are available for \$1 80 each (other countries add \$1 per back issue for postage).
